Source: PRIMES

(A) including the part of electricity and heat generated by renewables

(B) excluding payments for auctioned emission allowances (if applicable)

(C) Recently, Eurostat introduced a new indicator termed "share of renewables in Gross Final Energy Consumption", which is measured as a ratio of renewable energy used in all sectors (including the part of electricity and heat generated by renewables) over final energy demand increased by distribution losses and self consumption of electricity and steam.

Disclaimer: Energy and transport statistics reported in this publication and used for the modelling are taken mainly from EUROSTAT and from the publication "EU Energy and Transport in Figures" of the Directorate General for Energy and Transport. Energy and transport statistical concepts have developed differently in the past according to their individual purposes. Energy demand in transport reflects usually sales of fuels at the point of refuelling, which can differ from the region of consumption. This is particularly relevant for airplanes and trucks. Transport statistics deal with the transport activity within a country but may not always fully include transit shipments. These differences should be borne in mind when comparing energy and transport figures. This applies in particular to transport activity ratios, such as energy efficiency in freight transport, which is measured in tonnes of oil equivalent per million tonne-km.

Abbreviations

GIC: Gross Inland Consumption

CHP: combined heat and power

Units

toe: tonne of oil equivalent, or 10⁷ kilocalories, or 41.86 GJ (Gigajoule)

ktoe: 1000 toe

MW: Megawatt or 10⁶ watt

MWh: megawatt-hour or 10⁶ watt-hours

GWh: gigawatt-hour or 10⁹ watt-hours

t: metric tonnes, or 1000 kilogrammes

Mt: Million metric tonnes

km: kilometre

pkm: passenger-kilometre (one passenger transported a distance of one kilometre)

tkm: tonne-kilometre (one tonne transported a distance of one kilometre)

Gpkm: Giga passenger-kilometre, or 10⁹ passenger-kilometre

Gtkm: Giga tonne-kilometre, or 10⁹ tonne-kilometre

Source: PRIMES

(A) including the part of electricity and heat generated by renewables

(B) excluding payments for auctioned emission allowances (if applicable)

(C) Recently, Eurostat introduced a new indicator termed "share of renewables in Gross Final Energy Consumption", which is measured as a ratio of renewable energy used in all sectors (including the part of electricity and heat generated by renewables) over final energy demand increased by distribution losses and self consumption of electricity and steam.

(D) Total Compliance Costs do not include eventual costs associated with JI/CDM nor payments or revenues from possible exchanges of Guarantees of Origin

Disclaimer: Energy and transport statistics reported in this publication and used for the modelling are taken mainly from EUROSTAT and from the publication "EU Energy and Transport in Figures" of the Directorate General for Energy and Transport. Energy and transport statistical concepts have developed differently in the past according to their individual purposes. Energy demand in transport reflects usually sales of fuels at the point of refuelling, which can differ from the region of consumption. This is particularly relevant for airplanes and trucks. Transport statistics deal with the transport activity within a country but may not always fully include transit shipments. These differences should be borne in mind when comparing energy and transport figures. This applies in particular to transport activity ratios, such as energy efficiency in freight transport, which is measured in tonnes of oil equivalent per million tonne-km.

Abbreviations

GIC: Gross Inland Consumption

CHP: combined heat and power

Units

toe: tonne of oil equivalent, or 10^7 kilocalories, or 41.86 GJ (Gigajoule)

ktoe: 1000 toe

MW: Megawatt or 10^6 watt

MWh: megawatt-hour or 10^6 watt-hours

GWh: gigawatt-hour or 10^9 watt-hours

t: metric tonnes, or 1000 kilogrammes

Mt: Million metric tonnes

km: kilometre

pkm: passenger-kilometre (one passenger transported a distance of one kilometre)

tkm: tonne-kilometre (one tonne transported a distance of one kilometre)

Gpkm: Giga passenger-kilometre, or 10^9 passenger-kilometre

Gtkm: Giga tonne-kilometre, or 10^9 tonne-kilometre

Source: PRIMES

(A) including the part of electricity and heat generated by renewables

(B) excluding payments for auctioned emission allowances (if applicable)

(C) Recently, Eurostat introduced a new indicator termed "share of renewables in Gross Final Energy Consumption", which is measured as a ratio of renewable energy used in all sectors (including the part of electricity and heat generated by renewables) over final energy demand increased by distribution losses and self consumption of electricity and steam.

(D) Total Compliance Costs do not include eventual costs associated with JI/CDM nor payments or revenues from possible exchanges of Guarantees of Origin

Disclaimer: Energy and transport statistics reported in this publication and used for the modelling are taken mainly from EUROSTAT and from the publication "EU Energy and Transport in Figures" of the Directorate General for Energy and Transport. Energy and transport statistical concepts have developed differently in the past according to their individual purposes. Energy demand in transport reflects usually sales of fuels at the point of refuelling, which can differ from the region of consumption. This is particularly relevant for airplanes and trucks. Transport statistics deal with the transport activity within a country but may not always fully include transit shipments. These differences should be borne in mind when comparing energy and transport figures. This applies in particular to transport activity ratios, such as energy efficiency in freight transport, which is measured in tonnes of oil equivalent per million tonne-km.

Abbreviations

GIC: Gross Inland Consumption

CHP: combined heat and power

Units

toe: tonne of oil equivalent, or 10^7 kilocalories, or 41.86 GJ (Gigajoule)

ktoe: 1000 toe

MW: Megawatt or 10^6 watt

MWh: megawatt-hour or 10^6 watt-hours

GWh: gigawatt-hour or 10^9 watt-hours

t: metric tonnes, or 1000 kilogrammes

Mt: Million metric tonnes

km: kilometre

pkm: passenger-kilometre (one passenger transported a distance of one kilometre)

tkm: tonne-kilometre (one tonne transported a distance of one kilometre)

Gpkm: Giga passenger-kilometre, or 10^9 passenger-kilometre

Gtkm: Giga tonne-kilometre, or 10^9 tonne-kilometre

▶ Model-based Analysis of the 2008 EU Policy Package on Climate Change and Renewables

▶ Appendix 4: EC Proposal with RES trading

By P. Capros, L. Mantzos, V. Papandreou, N. Tasios

▶ *Primes Model* – E3MLab/NTUA
Results of end January 2008

SUMMARY ENERGY BALANCE AND INDICATORS (B)										EU27: EC proposal with RES trading			
	1990	1995	2000	2005	2010	2015	2020	2025	2030	'90-'00	'00-'10	'10-'20	'20-'30
	Annual % Change												
Main Energy System Indicators													
Population (Million)	470.388	476.493	480.506	489.091	492.946	495.353	496.408	496.268	494.784	0.2	0.3	0.1	0.0
GDP (in 000 M€05)	8108.7	8712.4	10046.1	10949.3	12430.0	14059.2	15686.9	17265.7	18687.0	2.2	2.2	2.4	1.8
Gross Inl. Cons./GDP (toe/M€05)	203.5	189.5	170.4	165.4	144.7	126.4	113.0	103.5	96.4	-1.8	-1.6	-2.4	-1.6
Carbon intensity (t of CO ₂ /toe of GIC)	2.45	2.31	2.23	2.18	2.11	1.99	1.88	1.81	1.70	-0.9	-0.6	-1.1	-1.0
Import Dependency %	44.4	43.3	46.7	52.4	54.9	57.8	59.2	59.5	59.3				
Total Energy-related Costs ^(B) (in 000 M€05)			977.6	1080.5	1248.0	1429.9	1607.2	1738.8	1849.1		2.5	2.6	1.4
as % of GDP			9.7	9.9	10.0	10.2	10.2	10.1	9.9				
Energy intensity indicators													
Industry (Energy on Value added, index 2000=100)	132.0	115.0	100.0	94.5	87.6	79.9	72.8	67.5	64.1	-2.7	-1.3	-1.8	-1.3
Residential (Energy on Private Income, index 2000=100)	114.2	112.7	100.0	96.9	87.9	77.3	70.3	63.9	58.7	-1.3	-1.3	-2.2	-1.8
Tertiary (Energy on Value added, index 2000=100)	126.3	117.3	100.0	97.5	86.7	74.4	66.6	60.7	55.9	-2.3	-1.4	-2.6	-1.7
